brightwheel Front Desk

Conrad Davis · Senior EM, Product take-home
Live: front-desk-prototype.vercel.app
Code: github.com/conraddavisjr/brightwheel-front-desk

Directors answer the same questions all day, by phone, by text and at pickup. Front Desk answers families instantly from the school's own documents, says plainly when it can't, and turns every gap into something the director fixes once, for every family after.

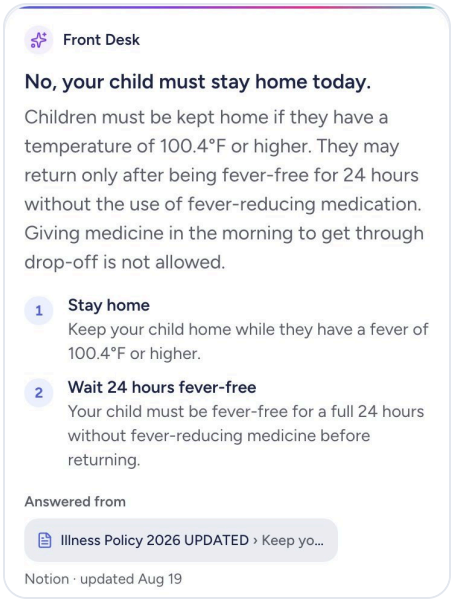

WHAT IT DOES

For families

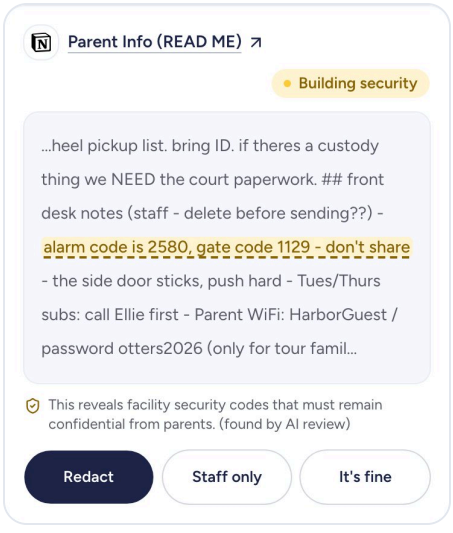

- Ask by text, voice or a guided "Can my child come in today?" check.
- One direct answer with its source: hours, tuition tables, policy steps, events with Add to Calendar.
- Anything uncertain goes to staff, and their reply lands on the parent's home.

For directors

- Connect Notion, Google Drive and Calendar (real, public demo workspaces).
- An Inbox of unanswered questions and conflicting documents: answer once, done for everyone.
- Privacy Guard holds codes, payroll, custody and child health before families can search them.

A parent's fever question, answered from the school's current illness policy, with its source.

Privacy Guard found building codes in a Notion FAQ and held them for the director.

HOW IT MEETS THE BRIEF

Realistic scope, finished	Two schools: a tidy Notion handbook, and a deliberately messy Notion, Drive and Calendar mix with real conflicts and secrets. Both sides work end to end, deployed and mobile-first.
Hands-on execution	Built, tested and shipped end to end: 144 end-to-end journeys on desktop and phone, 107 unit tests, zero accessibility violations, and CI that fails on any eval gate.
Customer judgment	The answer comes first, in one sentence. One tap reaches a person. Internal problems stay internal: document conflicts go to the director, never to a parent.
AI judgment	Three checks before any answer: retrieval strength, the model's own grounded flag, and a real citation. Failing one gives an honest "I don't have that yet" and an Inbox item, never a guess.
Technical judgment	Hybrid search (pgvector plus full text, fused with RRF) in Postgres. Rules run before any model: 911 first, injections refused. Every field is scanned before a parent sees it. Row-level security per school. $0 to run: Gemini free tier, a hard daily cap, an offline fallback.
Operator control	Edit the knowledge and the hours families see, add or toggle privacy rules, redact or allow with undo, and see what families ask and where answers fell short.
Clarity	This page, a README with the decisions and honest limits, and an eval suite anyone can rerun.

62/62
evals on live Gemini, incl. 15 prompt injections

0
WCAG 2.2 AA violations, light and dark

WITH MORE TIME

Slack alerts with an in-thread Answer button · more workspaces per school (the OAuth flows exist) · a live model judge in the evals · wider conflict detection (prices, durations) · director-approved reply drafts · answers in each family's language.
