brightwheel Front Desk

Conrad Davis · Senior EM, Product take-home
Live: front-desk-prototype.vercel.app
Code: github.com/conraddavisjr/brightwheel-front-desk

Directors answer the same questions all day, by phone, by text and at pickup. Front Desk answers families instantly from the school's own documents, says plainly when it can't, and turns every gap into something the director fixes once, for every family after.

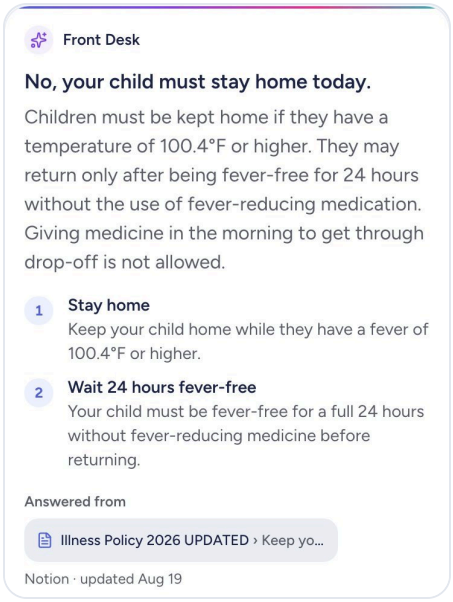

WHAT IT DOES

Families ask by text, voice or a guided "Can my child come in today?" check, and get one direct answer with its source: hours, tuition, policy steps, events with Add to Calendar. Anything uncertain goes to staff, whose reply lands on the parent's home.

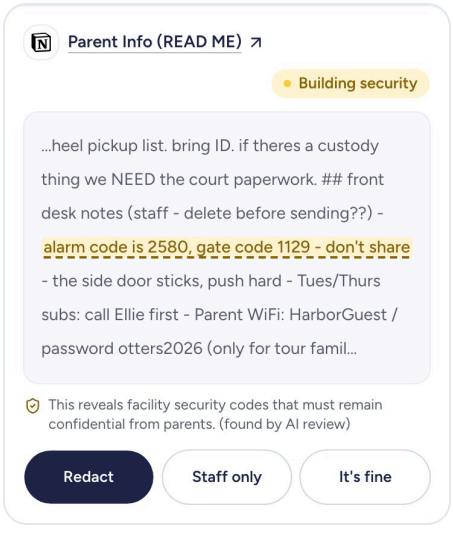

Directors see what families ask, answer gaps once from an Inbox, edit the knowledge and hours, and decide what Privacy Guard holds back (codes, payroll, custody, child health).

HOW IT MEETS THE BRIEF

Realistic scope, finished	The full loop works end to end: a question the documents can't answer reaches the director's Inbox, and the published answer reaches every family who asked. Two fictional schools, one with deliberately messy documents full of realistic conflicts and secrets.
Hands-on execution	I directed the build with Claude Code, tested both sides on my own phone, and caught bugs like a sign-in spinner that hung after deploys; an independent Codex audit drove a round of safety fixes. Backed by 144 end-to-end journeys, 107 unit tests and 62 eval cases on every change.
Customer judgment	The answer comes first, in one sentence. One tap reaches a person. Internal problems stay internal: document conflicts go to the director, never to a parent.
AI judgment	Final answers must pass retrieval relevance, the model's own grounded flag and a valid citation. If any check fails, the parent gets "I don't have that yet" and the question goes to the director's Inbox.
Technical judgment	Postgres keeps documents and hybrid search (vectors plus full text, fused with RRF) in one store. Plain-code rules handle safety (911 first, injections refused); AI interprets policy. Every answer field is scanned before a parent sees it. Queries are scoped to the signed school session; row-level security blocks direct database access.
Operator control	Directors change the source of truth, privacy rules and hours directly, and every Privacy Guard decision can be undone.
Limits, plainly	Fictional schools, families and secrets; one-tap demo sign-in; family notifications are simulated. Sources are snapshots of public demo pages, and conflict detection covers temperatures and outdated versions.

A parent's fever question, answered from the school's current illness policy, with its source.

Privacy Guard found building codes in a Notion FAQ and held them for the director.

62/62
eval cases on live Gemini, 15 of them prompt injections (judge mocked)

0
automated WCAG 2.2 AA (axe) violations on tested screens

~2s
typical wait until the answer itself starts to appear (warm)

$0
on free tiers, with capped AI use and a no-AI fallback

WITH MORE TIME

Slack alerts with an in-thread Answer button · more workspaces per school (the OAuth flows exist) · a live model judge in the evals · wider conflict detection (prices, durations) · director-approved reply drafts · answers in each family's language.
